

Academic Screening Tools Chart Rating Rubric

Please note that the following rubrics are applied separately for each sub-scale and for each grade level targeted by the tool.

Tools Chart Tab 1: Classification Accuracy

1A. Classification Accuracy

Note: Classification Accuracy will be rated separately for each criterion measure and time of year for the administration (e.g., Fall, Winter, Spring). Ratings will be provided for up to two different criterion measure and up to three different time points. Data for additional criterion measures or administration times may be reported, but will not be rated.

Rating	Definition
Full Bubble	All of Q1 – Q3 rated as YES <i>and</i> The lower bound of the confidence interval around the Area Under the Curve (AUC) estimate ≥ 0.80 <i>and</i> Sensitivity ≥ 0.70 and Specificity ≥ 0.80
Half Bubble	All of Q1-Q3 rated as YES <i>and</i> (a) The lower bound of the confidence interval around the AUC estimate ≥ 0.70 but < 0.80 <i>or</i> (b) Sensitivity ≥ 0.60 and Specificity ≥ 0.70
Empty Bubble	Does not meet full or half bubble

- Q1. Was an appropriate external measure of academic performance used as an outcome?
- Q2. Was risk adequately defined within an RTI approach to screening (e.g., 20th percentile), and consistent with base rate?
- Q3. Were the classification analyses and cut-points adequately performed?

Area Under the Curve (AUC) Statistic: an overall indication of the diagnostic accuracy of a Receiver Operating Characteristic (ROC) curve. ROC curves are a generalization of the set of potential combinations of sensitivity and specificity possible for predictors. AUC values closer to

1 indicate the screening measure reliably distinguishes among students with satisfactory and unsatisfactory reading performance, whereas values at 0.50 indicate the predictor is no better than chance.

Tools Chart Tab 2: Technical Standards

2A: Reliability

Rating	Definition
Full Bubble	<p>(a) A model-based approach to reliability was reported <i>or</i> (b) At least two other types of reliability were reported appropriate for the purpose of the tool, and drawn from at least two samples that are representative of students across all performance levels</p> <p><i>and</i> For each type of reliability reported the lower bound of the confidence interval around the median estimate met or exceeded 0.70</p>
Half Bubble	<p>(a) A model-based approach to reliability was reported <i>or</i> (b) At least two other types of reliability were reported appropriate for the purpose of the tool, drawn from at least one sample that is representative of students across all performance levels</p> <p><i>and/or</i> For each type of reliability reported the lower bound of the confidence interval around the median estimate fell below 0.70 but met or exceeded 0.60</p>
Empty Bubble	Does not meet full or half bubble
Dash	Reliability data were not provided

2B: Validity

Rating	Definition
Full Bubble	There are at least two types of appropriately justified validity analyses* from a sample representative of students across all performance levels and The lower bound of the confidence interval around each standardized estimate met or exceeded 0.60 (or if not, within an acceptable range given the expected relationship with the criterion measure(s))
Half Bubble	Analyses, measures, and sample were appropriate, but evidence was mixed, with one or more estimate(s) either not meeting or exceeding 0.60 or not within an acceptable range given the expected relationship with the criterion measure(s)
Empty Bubble	Does not meet full or half bubble
Dash	Validity data were not provided

*Appropriately justified analyses must include at least one criterion measure that is external to the screening system and theoretically linked to the underlying construct measured by the tool.

2C: Sample Representativeness

Rating	Definition
Full Bubble	Large representative national sample (at least 150 students across at least three geographic regions*) and Cross-validation (i.e., multiple studies)
Half Bubble	Large representative national sample (at least 150 students across at least three geographic regions) or multiple regional/state samples with no cross-validation or One or more regional/state samples with cross-validation
Empty Bubble	One regional or state sample with no cross-validation or One or more local samples

*Regions defined by Census geographical divisions: https://www2.census.gov/geo/pdfs/maps-data/maps/reference/us_regdiv.pdf

2D: Bias Analysis

Bias Analysis refers to an analysis that examines the degree to which a tool is or is not biased against subgroups (e.g., race/ethnicity, gender, socioeconomic status, students with disabilities, English language learners)

Rating	Definition
Yes	One or more of the following three types of analyses were conducted: 1. Multiple-group confirmatory factor models for categorical item responses 2. Explanatory group models such as multiple-indicators, multiple-causes (MIMIC) or explanatory IRT with group predictors 3. Differential Item Functioning from Item Response Theory (DIF in IRT) 4. Testing differential classification accuracy across demographic groups
No	Does not meet “yes”
